

Syllabus

Descrizione corso

Titolo insegnamento	Chimica generale ed inorganica
Codice insegnamento	42102
Titolo aggiuntivo	
Settore Scientifico-Disciplinare	CHEM-03/A
Lingua	Tedesco
Corso di Studio	Corso di laurea in Ingegneria Industriale Meccanica
Altri Corsi di Studio (mutuati)	
Docenti	dr. mag. Michael Oberhuber, Michael.oberhuber2@unibz.it https://www.unibz.it/en/faculties/engineering/academic-staff/person/39871
Assistente	
Semestre	Primo semestre
Anno/i di corso	1
CFU	6
Ore didattica frontale	36
Ore di laboratorio	36
Ore di studio individuale	78
Ore di ricevimento previste	18
Sintesi contenuti	<p>The aim of the course is to provide students with an adequate command of general chemical principles.</p> <ul style="list-style-type: none">- Atomic theory, the chemical bond, and the periodic table- States of matter and phase transitions- Stoichiometry, reaction equations, basic thermodynamics and catalysis- Chemical reactions (solvation, acid-base, redox incl. electrochemistry)- The chemical equilibrium- Crystal structures

	<ul style="list-style-type: none"> - Macromolecular chemistry and nanotechnology - Biomolecules - Reaction kinetics
Argomenti dell'insegnamento	<p>This course provides students with a foundational understanding of general chemical principles, aiming to build a comprehensive knowledge of matter and its transformations at the atomic and molecular levels.</p> <p>The course begins with an introduction to atomic theory, chemical bonding, and the periodic table, laying the groundwork for the study of more complex topics. The physical states of matter and phase transitions are explored, along with the principles of stoichiometry and the formulation of balanced chemical equations. Students will gain insight into fundamental thermodynamics and the role of catalysis in chemical reactions.</p> <p>Core types of chemical reactions—such as solvation, acid-base interactions, redox processes, and electrochemistry—are examined in detail. The concept of chemical equilibrium is addressed, highlighting its significance in both theoretical and applied contexts.</p> <p>The structure and properties of crystalline solids are also covered, offering an introduction to crystallography. Additionally, the course delves into macromolecular chemistry. Reaction kinetics is discussed to provide a framework for understanding the rates and mechanisms of chemical processes.</p> <p>Overall, the course equips students with essential tools and concepts to analyze chemical systems and processes across a broad range of scientific disciplines.</p>
Parole chiave	General and inorganic chemistry, stoichiometry, chemical reactions, thermodynamics, kinetics
Prerequisiti	None.
Insegnamenti propedeutici	
Modalità di insegnamento	Frontal lectures, exercises, labs.
Obbligo di frequenza	Not mandatory
Obiettivi formativi specifici e	The course is part of the courses in the area of basic sciences and

risultati di apprendimento attesi	<p>specifically in the context of chemical sciences.</p> <p>The purpose of the course is to provide the basic knowledge on the structure of matter as well as the thermodynamic and kinetic principles that regulate its transformation. Special attention will be given to a molecular understanding of the properties of matter through the study of the structural and functional aspects of simple molecules with relevance for the bio-geo-chemical cycles of the elements. In addition, the knowledge acquired in this course will be useful to understand topics from materials science and energy production.</p> <p>Intended Learning Outcomes (ILO)</p> <p>Knowledge and understanding:</p> <ol style="list-style-type: none"> 1. Structure-properties-relationship of matter 2. Chemical transformation of matter 3. Chemical equilibrium, principles of thermodynamics and kinetics 4. Electrochemistry 5. Chemical properties of selected materials and metals <p>Applying knowledge and understanding:</p> <ol style="list-style-type: none"> 6. to chemical calculations 7. to laboratory experiments 8. to material science relevant to engineering <p>Making judgments:</p> <ol style="list-style-type: none"> 9. Chemical aspects of material science 10. On laboratory experiments and their outcomes. <p>Communication skills:</p> <ol style="list-style-type: none"> 11. Express chemical problems in writing 12. Writing reports on laboratory experiments <p>Learning skills</p> <ol style="list-style-type: none"> 13. Understanding invisible and intangible phenomena and concepts without equivalent on the macroscale (molecules, quantum mechanics etc.) 14. Laboratory experiments.
Obiettivi formativi specifici e risultati di apprendimento attesi (ulteriori info.)	
Modalità di esame	<p>Examination of the course is conducted via a written exam. The</p>

	<p>written exam is a multiple-choice test and consists of three parts: i) theory questions to assess the knowledge and understanding of the course topics and the theoretical aspects, ii) questions, where the ability to apply the theoretical knowledge to given problems, and iii) exercises with chemical calculations.</p> <p>- Summative assessment: 40% Written exam theory: 40 minutes; ILOs assessed: 1,2,3,4,5,8,9,10,11,13; 30% written exam problems: 40 minutes; ILOs assessed: 1,2,3,4,5,6,8,9,10,11,13; 30% written exam exercises: 40 minutes; ILOs assessed: 1,2,3,4,5,6,8,9,10,11,13.</p> <p>In class exercises (incl. laboratory): 6 x 240 minutes; ILOs assessed: 2,3,6,7,11,12,13,14.</p>
Criteri di valutazione	<p>Grading with a single final grade.</p> <p>Criteria for grading: comprehension, problem-solving skills, technical competence. Laboratory reports: the ability to summarize the experiment, describe essential steps, clarity and linguistic quality of the response, and correct calculation of results will be evaluated.</p>
Bibliografia obbligatoria	<p>Guido Kickelbick „Chemie für Ingenieure“, Pearson Verlag.</p>
Bibliografia facoltativa	<p>Charles E. Mortimer und Ulrich Müller „Chemie: Das Basiswissen der Chemie“, Chemie Verlag.</p>
