

Syllabus

Course Description

Course Title	Smart Grids
Course Code	45550
Course Title Additional	
Scientific-Disciplinary Sector	IIND-08/B
Language	English
Degree Course	Master in Energy Engineering
Other Degree Courses (Loaned)	
Lecturers	Dr. Vincenzo Trovato, Vincenzo.Trovato@unibz.it https://www.unibz.it/en/faculties/engineering/academic-staff/person/46153
Teaching Assistant	
Semester	Second semester
Course Year/s	Opt.
CP	6
Teaching Hours	60
Lab Hours	0
Individual Study Hours	90
Planned Office Hours	18
Contents Summary	The course and develops mainly the subjects of the operation and regulation of the national grid high voltage. After outlining the international framework of regulatory boards (CEN, CENELEC, ETSI, IEC, UCTE, etc ...), it introduces the equations of three-phase lines with the propagation constant and the characteristic impedance. It will explain then technological innovation on electric transmission and distribution, as well as the control system in real time. It will be explained the mechanisms to control voltage and frequency according to the request of reactive and active power. It will also expose the criteria for the protection of the transmission lines and

	moreover the problem of power quality and the characteristics of the free market.
Course Topics	The course will cover the following topics: 1. Energy situation 2. Electrical circuit representation of transmission networks 3. Sinusoidal transmission lines 4. Management of networks and interconnection 5. Voltage control 6. Frequency control 7. Stability of the network 8. Overvoltage of internal origin and protection networks 9. Power quality 10. Free market energy
Keywords	Smart grids; Stability of the network; Free market energy; Transmission networks
Recommended Prerequisites	Students attending this course should already be familiar with the topics dealt in previous bachelor's and master's degree level courses, such as Physics II, Electrotechnics and Electrical Systems Engineering.
Propaedeutic Courses	The Smart Grids Course is strictly related to the Electrical Systems Engineering course.
Teaching Format	Frontal lectures and seminars.
Mandatory Attendance	Not mandatory but recommended.
Specific Educational Objectives and Learning Outcomes	At the end of the course, students will have the following skills: 1. Knowledge and understanding: Understand the operation and design MV and HV AC power supply lines; 2. Applying knowledge and understanding: Being able to participate in the management of an electrical transmission network for controlling the frequency and voltage of the network; 3. Making judgements: Knowing how to judge, identify and resolve anomalies and failure conditions of the electricity transmission grids; 4. Communication skills: Interact with other operators and technicians to operate in the free energy market;

	5. Ability to learn: Learn and develop new high voltage line protection systems.
Specific Educational Objectives and Learning Outcomes (additional info.)	
Assessment	The evaluation of students' training will take place with an oral test as summative assessment, during which the degree of learning (ILOs 1 and 5) and the ability to manage a transmission network (ILOs 2 and 3) will be assessed, together with their communication skills (ILO 4).
Evaluation Criteria	The preparation of the students will be assessed based on the degree of: • technical preparation of the topics covered; • learning of the operating and management methods of the electricity distribution and transmission networks; • ability to evaluate fault conditions and recovery methods.
Required Readings	PowerPoint presentations will be available in the course reserve collection database.
Supplementary Readings	• M. Fauri, F. Gnesotto, G. Marchesi, A. Maschio, Lezioni di Elettrotecnica (vol. 2 Applicazioni Elettriche), Esculapio Editore, Bologna, 2002 • L. Fellin, R. Benato, Impianti elettrici, Utet Scienze Tecniche • A. Paolucci, Trasmissione dell'energia elettrica, Padova • F. M. Gatta, Impianti elettrici, Esculapio Editore, Bologna, 2018 Additional material will be provided by the Professor.
Further Information	The Smart Grids Course is strictly related to the Electrical Systems Engineering course. The training of students allows them to find professional applications in: • public and private companies that manage electricity distribution and transmission networks. • industries that produce electrical equipment for medium voltage and high voltage.
Sustainable Development	Affordable and clean energy, Industry, innovation and

Goals (SDGs)	infrastructure, Climate action, Responsible consumption and production, Sustainable cities and communities
