Syllabus

Kursbeschreibung

Titel der Lehrveranstaltung	Labor für Sicherheit und Lebenszyklusanalyse
Code der Lehrveranstaltung	42640
Zusätzlicher Titel der Lehrveranstaltung	
Wissenschaftlich-disziplinärer Bereich	NN
Sprache	Italienisch
Studiengang	Berufsbildender Bachelor in Holztechnik
Andere Studiengänge (gem. Lehrveranstaltung)	
Dozenten/Dozentinnen	Prof. Luca Gualtieri, Luca.Gualtieri@unibz.it https://www.unibz.it/en/faculties/engineering/academic-staff/person/38728
Wissensch. Mitarbeiter/Mitarbeiterin	
Semester	Erstes Semester
Studienjahr/e	3
KP	2
Vorlesungsstunden	0
Laboratoriumsstunden	20
Stunden für individuelles Studium	30
Vorgesehene Sprechzeiten	6
Inhaltsangabe	Risk in the Workplace - Qualitative and quantitative risk assessment methodologies - Accident and injury databases - Case study discussions Safety of Machinery - The hybrid method for machine risk assessment - Guided exercises on safe machine design

	- Case study discussions Ergonomic Design of Production Systems - The Rapid Upper Limb Assessment (RULA) method for evaluating biomechanical overload - Other methodologies for assessing biomechanical overload - Guided exercises on physical ergonomics and human reliability - Case study discussions Digital Human Modeling and Virtual Ergonomics - Introduction to the "Tecnomatix Process Simulate" software, basic commands, and the "Human" module - Guided exercises using the software to support human-centered design and ergonomic analysis Life Cycle Assessment (LCA) - Environmental impact assessment of a product/process - Case study discussions.
Themen der Lehrveranstaltung	Risk in the Workplace - Qualitative and quantitative risk assessment methodologies - Accident and injury databases - Case study discussions Safety of Machinery - The hybrid method for machine risk assessment - Guided exercises on safe machine design - Case study discussions Ergonomic Design of Production Systems - The Rapid Upper Limb Assessment (RULA) method for evaluating biomechanical overload - Other methodologies for assessing biomechanical overload - Guided exercises on physical ergonomics and human reliability - Case study discussions Digital Human Modeling and Virtual Ergonomics - Introduction to the "Tecnomatix Process Simulate" software, basic commands, and the "Human" module - Guided exercises using the software to support human-centered design and ergonomic analysis Life Cycle Assessment (LCA) - Environmental impact assessment of a product/process - Case study discussions.
Stichwörter	Occupational Health and Safety; Risk Assessment;

	Safety of Machinery; Physcial/Cognitive Ergonomics; Life Cyle Assessment;
Empfohlene Voraussetzungen	None.
Propädeutische Lehrveranstaltungen	
Unterrichtsform	Frontal lectures, exercises, case study discussions, individual or group work.
Anwesenheitspflicht	Recommended.
Spezifische Bildungsziele und erwartete Lernergebnisse	Considering the manufacturing context and the wood industry, the Safety and LCA Assessment course aims to provide students with both basic and advanced knowledge related to the evaluation and management of risks (both traditional and emerging) in the workplace, safe and compliant machine design, human-centered design of workstations and systems, human modeling, ergonomic analysis and reduction of biomechanical overload supported by simulation, psychosocial aspects, and human reliability. The course will also introduce the fundamentals of Life Cycle Assessment (LCA) and the sustainability of industrial systems. Theoretical content will be explored in depth through case study analyses and guided exercises. The Intended Learning Outcomes (ILOs) are listed below and are aligned with the Dublin Descriptors: Knowledge and Understanding The student knows the basic concepts related to occupational health and safety, safe machinery design, ergonomics, psychosocial aspects, and human-centered design of production/logistics systems and processes. The student is familiar with common approaches to assess and control health and safety risks in production processes, as well as methodologies for human-centered design of systems and processes. Applying Knowledge and Understanding The student has the opportunity to apply and understand theoretical content through exercises, case studies, and analytical activities. Theoretical content is illustrated through practical examples and, where applicable, through numerical or qualitative

	exercises. The student identifies, analyzes, and evaluates measures to reduce major health and safety risks in realistic scenarios. The student applies the fundamentals of safe and human-centered design in production and logistics systems. Making Judgements Based on specific practical situations, the student is able to evaluate the adoption of the most appropriate approaches for managing health and safety in the workplace, as well as for safe and human-centered design of production systems. The student is able to interpret, at a preliminary level, the results of a risk assessment concerning a specific production system or process. Communication Skills The student is able to engage in technical discussions on health and safety, ergonomics, human-centered design, and safety of machinery. They can prepare, present, and discuss content in a structured manner. Learning Skills The student learns through lectures (theoretical part), case study discussions, in-class exercises, and hands-on activities. The student is able to expand their knowledge through individual study and by consulting standards and technical materials.
Spezifisches Bildungsziel und erwartete Lernergebnisse (zusätzliche Informationen)	
Art der Prüfung	Summative assessment: - Exercises and case studies addressed in class, during lectures; ILOs verified: 2,3,4,5,6,7,10. - Repetitions before lectures: 5-10 min. at the beginning of each lecture; ILOs verified: 1,2,3,4,5,6,7,8,9. - Results of the exercises (modeling, simulation, analysis, report) and the related discussion, during lectures (exercises); ILOs verified 2,5,6,7. Summative assessment: Results of the exercises (modeling, simulation, analysis, report) and the related discussion; modality PASS/NOT PASS; length:

	Individual or group work + 15-minute in-class discussion (10-minute presentation, 5-minute Q&A); ILOs verified 2,5,6,7,8.
Bewertungskriterien	Final evaluation PASS/FAIL The final grade is determined by the results of the written exam (theory and exercises), as well as the assessment of practical skills. The laboratory activity is evaluated based on the results of the individual/group work (modeling, simulation, analysis, report, presentation) and the related discussion. Assessment criteria for laboratory activities: correctness and completeness of the results and analyses, as well as the quality of the discussion and the completeness of the answers to specific questions.
Pflichtliteratur	Course notes and materials provided by the lecturer.
