Mitarbeiter/Mitarbeiterin	
Semester	Erstes Semester
Studienjahr/e	1
КР	12
Vorlesungsstunden	80
Laboratoriumsstunden	40
Stunden für individuelles	180
Studium	
Vorgesehene Sprechzeiten	
Inhaltsangabe	Introduction to Python and programming environment
	Python data structures and programming primitives
	Object-oriented programming in Python

	Writing structured/reusable code in Python: functions, classes, libraries
	Code documentation, testing, version-control, and distribution
	Advanced Python programming
	The data science pipeline: from raw data to advanced analytics
	and visualization
	Data ingestion, exploration, cleaning, and pre-processing
	Feature analysis and engineering
	Machine learning for data modelling: clustering, classification
	and regression
	Model tuning, validation, and testing
	Advanced data visualization
Themen der	Module 1: Programming in Python
Lehrveranstaltung	The course is designed to provide specific professional skills for
	advanced programming in Python. The students will learn how to
	develop a Python program, starting from designing it, and going
	through coding, testing and validation. They will master Python in
	its full object-oriented features, learning how to develop complex
	programs that are well structured, and make use of techniques for
	code re-use, pipelining, maintenance, and deployment.
	Module 2: Data Analysis and Visualization
	The course is designed to acquire professional skills and knowledge
	useful when dealing with large-scale datasets. In particular, the
	students will master data collection, exploration, transformation,
	curation, analysis, and visualization, choosing the most appropriate
	technique for the data at hand. They will make insights from the
	data, supported by a rigorous data science pipeline, which starts
	with raw data, produces machine learning models, and ends with
	advanced visualizations. This module, addresses common pitfalls
	that can mislead the analysis and makes extensive use of
	specialized Python libraries, acquiring the best practices of
	reproducible, data-driven analysis and research.
Stichwörter	Python Programming; data science; data curation; data modeling;
	machine learning; data visualization.
Empfohlene	Basic programming concepts. Linear algebra. Basic Statistics.

Propädeutische	
Lehrveranstaltungen	
	1

Unterrichtsform	The course adopts a blended, student-centered approach that emphasizes problem-based learning and active engagement. Selected lecture content is made available online in advance, enabling students to explore key concepts independently and at their own pace. This preparatory work allows in-person sessions to focus on applying knowledge through problem-solving, collaborative activities, and guided discussions—fostering critical thinking and deeper understanding. The teaching format combines frontal lectures, hands-on lab assignments, and project work, ensuring that students develop both theoretical knowledge and practical skills in python programming, and in data analysis, modelling, and visualization. The course is aligned with the principles of the EDUNEXT initiative (https://edunext.eu), promoted by Italian universities, which supports the integration of digital resources and active learning strategies in higher education.
Anwesenheitspflicht	Not compulsory. Non attending students have to agree with the lecturer on the modalities of independent study at the beginning of the course.
Spezifische Bildungsziele und erwartete Lernergebnisse	The course belongs to the type "caratterizzanti – discipline informatiche".
	The course is designed to provide specific professional skills for advanced programming in Python and professional skills and knowledge useful when dealing with large-scale datasets.
	 Knowledge and understanding: D1.1 - Knowledge of the key concepts and technologies of data science disciplines D1.2 - Understanding of the skills, tools and techniques required for an effective use of data science D1.3 - Knowledge of principles, methods and techniques for processing data in order to make them usable for practical purposes, and understanding of the challenges in this field D1.9 - Knowledge of the challenges in the field of manmachine interface and of the methods and techniques for overcoming these challenges D1.12 - Basic knowledge of the main ethical and social

	Applying knowledge and understanding:
	D2.1 - Practical application and evaluation of tools and
	techniques in the field of data science
	D2.4 - Ability to develop programmes and use tools for the
	analysis and management of data and related infrastructures
	D2.8 - Practical application and evaluation of tools and
	techniques for data analysis
	D2.9 - Design, application and evaluation of technologies and
	tools for human-machine interaction, data exploration and data
	visualization
	Making judgments
	D3.2 - Ability to autonomously select the documentation (in the
	form of books, web, magazines, etc.) needed to keep up to date in
	a given sector.
	Communication skills
	D4.1 - Ability to use English at an advanced level with
	particular reference to disciplinary terminology
	D4.2 - Ability to present one's work in a clear and
	comprehensible way in front of an audience, including non-
	specialists
	D4.3 - Ability to structure and draft scientific and technical
	documentation
	Learning skills
	D5.3 – Ability to deal with problems in a systematic and
	creative way and to appropriate problem solving techniques.
Spezifisches Bildungsziel	
und erwartete	
Lernergebnisse (zusätzliche	
Informationen)	
Art der Prüfung	The exam modalities are the same for both the attending and the
	non-attending students.
	Project work (70% of the final grade) and oral exam (30% of the
	final grade).
	All project works must have been submitted, at the very latest, 15
	days ahead of the oral exam.
	In case of a positive mark, the projects will count for all 3 regular
	exam sessions.
Bewertungskriterien	70% project work, 30% oral exam.

	 Relevant for project work: clarity of presentation, ability to gain useful and novel insights from data, creativity, critical thinking, ability to adhere to reproducible research best practices Ability to use Python to write, evaluate and deploy advanced, object-oriented computer programs Ability to use Python to employ (understand, recall and use) data analytics methods in practical settings, from data collection and curation, to data analysis, modelling and visualization.
Pflichtliteratur	Data Visualization. A practical introduction. Haley. Available online

Inhaltsangabe	 Introduction to Python and programming environment Python data structures and programming primitives Object-oriented programming in Python Writing structured/reusable code in Python: functions, classes, libraries Code documentation, testing, version-control, and distribution Advanced Python programming
Themen der Lehrveranstaltung	This course provides students with advanced professional skills for developing robust and maintainable Python applications. It covers the full development lifecycle—from program design to implementation, testing, and validation. Students will master Python's object-oriented programming features and learn how to build well-structured, reusable, and modular code using functions, classes, and libraries. The course also introduces essential tools and techniques for code documentation, testing, version control, and distribution, preparing

	students for collaborative and production-level development environments.
Unterrichtsform	The course adopts a blended, student-centered approach that emphasizes problem-based learning and active engagement. Selected lecture content is made available online in advance, enabling students to explore key concepts independently and at their own pace. This preparatory work allows in-person sessions to focus on applying knowledge through problem-solving, collaborative activities, and guided discussions—fostering critical thinking and deeper understanding. The teaching format combines frontal lectures, hands-on lab assignments, and project work, ensuring that students develop both theoretical knowledge and practical programming skills. The course is aligned with the principles of the EDUNEXT initiative (https://edunext.eu), promoted by Italian universities, which supports the integration of digital resources and active learning strategies in higher education.

Inhaltsangabe	 The data science pipeline: from raw data to advanced analytics and visualization Data ingestion, exploration, cleaning, and pre-processing Feature analysis and engineering Machine learning for data modelling: clustering, classification and regression Model tuning, validation, and testing Advanced data visualization
Themen der Lehrveranstaltung	This course equips students with professional skills and knowledge essential for working with large-scale datasets. Through a handson and rigorous approach, students will learn to collect, explore, transform, curate, analyze, and visualize data—selecting the most appropriate techniques based on the nature and structure of the data. The course emphasizes the development of insights through a complete data science pipeline: starting from raw data, progressing through data preprocessing and machine learning modeling, and culminating in advanced visualizations. Students will gain practical experience using specialized Python libraries and will learn how to adopt best practices for reproducible, data-driven analysis and research. Common pitfalls in data analysis will be addressed, helping students to critically assess results and avoid misleading interpretations. By the end of the course, students will be able to design and implement robust analytical workflows that support decision-making and scientific inquiry.
