Syllabus

Kursbeschreibung

Titel der Lehrveranstaltung	Software Systems Engineering
Code der Lehrveranstaltung	76265
Zusätzlicher Titel der Lehrveranstaltung	
Wissenschaftlich-disziplinärer Bereich	
Sprache	Englisch; Italienisch
Studiengang	Bachelor in Informatik
Andere Studiengänge (gem. Lehrveranstaltung)	
Dozenten/Dozentinnen	Prof. Barbara Russo, Barbara.Russo@unibz.it https://www.unibz.it/en/faculties/engineering/academic-staff/person/2242 Prof. Eduardo Martins Guerra, Eduardo.MartinsGuerra@unibz.it https://www.unibz.it/en/faculties/engineering/academic-staff/person/43879
Wissensch. Mitarbeiter/Mitarbeiterin	
Semester	Zweites Semester
Studienjahr/e	2
KP	12
Vorlesungsstunden	70
Laboratoriumsstunden	50
Stunden für individuelles Studium	180
Vorgesehene Sprechzeiten	
Inhaltsangabe	- Software and systems architecture principles - Software architecture design process - Architectural components and frameworks

	- Approaches for architectural partitioning - Architectural patterns and styles - Integrating AI Components into Architectural Designs - Verification and validation - Techniques for black-box and white-box texting - Techniques and tools for test automation - Integration and regression testing - Web testing - AI for test case generation
Themen der Lehrveranstaltung	The objective of the Software Systems Architecture Module is to provide students with a solid understanding of the role of software architecture within the software development lifecycle. Students will learn to design architectures using established patterns and best practices, gain an overview of various architectural styles and emerging trends, evaluate and balance trade-offs related to quality attributes, and apply different architectural approaches to the development of high-quality software. Tools and Techniques for Software Testing is designed to equip students with the ability to select, use, customize, and deploy software testing tools and techniques. It also enables them to configure and integrate these tools to support testing activities throughout the collaborative software development process.
Stichwörter	Software testing, prompt engineering for testing, agentic systems for testing
Empfohlene Voraussetzungen	Basic courses in Programming and Software Engineering. Familiarity with UML and the basics of object-oriented programming.
Propädeutische Lehrveranstaltungen	
Unterrichtsform	The course includes frontal lectures and lab exercises.
Anwesenheitspflicht	Attendance is not compulsory. Non-attending students have to contact the lecturer at the start of the course to agree on the modalities of the independent study.
Spezifische Bildungsziele und erwartete Lernergebnisse	Knowledge and Understanding - D1.8 To have a thorough knowledge of the main fundamentals techniques and methods of software design, development and

	maintenance Applying knowledge and understanding - D2.5 Be able to apply the own knowledge to the , design, development and testing of information systems which satisfy given requirements - D2.7 Be able to conduct simple experiments about information systems by collecting measures about the behaviour of the system. - D2.10 Be able to solve typical problems in computer science based on software engineering methodologies, such as the definition of requirements, the of possible methods for a solution, the selection of the most appropriate methods and tools as well as their application - D2.11 Be able to evaluate the quality of information systems and to identify critical aspects. Ability to make judgments - D3.1 Be able to collect and interpret useful data and to judge information systems and their applicability. - D3.2 Be able to work autonomously according to the own level of knowledge and understanding. - D3.3 Be able to take the responsibility for development of projects or IT consulting. Communication skills - D4.1 Be able to use one of the three languages English, Italian and German, and be able to use technical terms and communication appropriately. - D4.3 Be able to negotiate with a customer for the definition of the pre-requisites and features of information systems. - D4.4 Be able to structure and write technical documentation. Learning skills - D5.1 Have developed learning capabilities to pursue further studies with a high degree of autonomy. - D5.2 Have acquired learning capabilities that enable to carry out project activities in companies, public institutions or in distributed development communities. - D5.3 Be able to follow the fast technological evolution and to

	learn cutting edge IT technologies and innovative aspects of last generation information systems.
Spezifisches Bildungsziel und erwartete Lernergebnisse (zusätzliche Informationen)	
Art der Prüfung	A final unified written exam will be performed with verification questions from both modules. Each module will have the following additional activities during the course: Software Systems Architecture: Lab assessment is composed by assignments that should be performed and delivered in each week. Optional activities might worth extra points in the final module grade. Tools and Techniques for Software Testing: Project work with group assignments
Bewertungskriterien	The written exam evaluates the student's ability to master the course terminology, assess tools and techniques in relation to their specific domain of use and technical details, solve exercises, and clearly summarize theoretical concepts. The assessment of project and lab work focuses on timely completion of assignments, the delivery of functional solutions, and the development or customization of high-quality software that meets the specified requirements. The final grade is calculated as the average of the grades obtained in each module. For Software Systems Architecture, the grade is based on two components: 50% from lab work and 50% from the module-specific questions in the final written exam. Optional activities within the module may provide extra credit. For Tools and Techniques for Software Testing, the grade is composed of 80% from project work and 20% from the relevant questions in the written exam. Completion and positive evaluation of the project is a prerequisite for accessing the written exam. For non-attending students, module instructors may offer two options: either complete lab assessments or projects under the same conditions as attending students, or undergo an additional

	evaluation based on questions related to lab or project content. Students must pass both modules to pass the course. A positive grade in one module remains valid for all three regular exam sessions within the academic year.
