

Syllabus

Descrizione corso

Titolo insegnamento	Probability Theory and Statistics	
Codice insegnamento	76210	
Titolo aggiuntivo		
Settore Scientifico- Disciplinare	MAT/06	
Lingua	Tedesco	
Corso di Studio	Corso di laurea in Informatica	
Altri Corsi di Studio (mutuati)		
Docenti	prof. Werner Nutt, Werner.Nutt@unibz.it https://www.unibz.it/en/faculties/engineering/academic-staff/person/7380	
Assistente	dott. Anton Gnatenko dott. Sergei Katkov	
Semestre	Primo semestre	
Anno/i di corso	2	
CFU	6	
Ore didattica frontale	40	
Ore di laboratorio	20	
Ore di studio individuale	90	
Ore di ricevimento previste		
Sintesi contenuti	The course offers an overview of the theory of probability in connection to its use in computer science and the use of statistics in analysing and understanding empirical data.	
Argomenti dell'insegnamento	 Basic concepts: probability spaces, conditional probability, Bayes' Theorem, independent events Random variables: distribution, density, expectation, variance, covariance, law of large numbers Special distributions: Bernoulli, Binomial, Poisson, Exponential, 	

Parole chiave Prerequisiti	Normal, Chi-Square, t-Distribution - Sampling: sums of random variables, central limit theorem, sample variance - Parameter Estimation: maximum likelihood estimates, interval estimates, confidence intervals - Hypothesis testing: significance levels, test statistics, p-values probability theory, statistics, random variables, probability distributions, hypothesis testing Students should be familiar with basic mathematical objects such
	as sets and functions and be able to manipulate them. In particular, they should be familiar with the convergence of sequences and series, exponential and logarithmic functions, derivatives and partial derivatives, and integration at the level of the introductory course Analysis.
Insegnamenti propedeutici	
Modalità di insegnamento	The course combines lectures, exercise groups with instructors, and coursework assignments that are corrected and commented on by Teaching Assistants. In the lectures, the instructor introduces new concepts and techniques using board work and projected material, complemented by short in-class exercises. The assignments give students the opportunity to consolidate these concepts by applying them to selected problems. In the exercise groups, students discuss possible approaches to the assignment tasks with the instructors and compare alternative solutions. They also work on additional problems, independent of the assignments, to deepen their understanding of the material
	covered in the lectures.
Obbligo di frequenza	Attendance is not mandatory but strongly recommended. The lectures combine visual presentations (board and projection), exercises, and discussions aimed at developing problem-solving skills in probability and statistics through practice. All materials and assignments are available on the OLE page, but slides and notes alone are not sufficient to master the course. Regular attendance, active participation in exercises, and timely submission of coursework are essential for success.

n	Libera Università di Bolzano Università Liedia de Bulsan		
	Obiettivi formativi specifici e risultati di apprendimento attesi	Knowledge and U - D1.1 Have a sol numerical calculu computer science - D1.18 Have a so	
		Applying knowled - D2.1 Be able to problems D2.21 Be able to theory to solve in	
		Ability to make ju - D3.2 Be able to knowledge and u - D3.5 Ability to d capability to find	
		Communication s	

Jnderstanding

- olid knowledge of mathematical, algebra, us, and elementary logic that are in support of e.
- solid knowledge of statistics and probability theory.

dge and understanding

- use the tools of mathematics and logic to solve
- to apply the tools of statistics and probability nformation technology issues

udgments

- work autonomously according to the own level of ınderstanding.
- discern between various probability models and appropriate models for a given application

skills

- D4.1 Be able to use one of the three languages English, Italian and German, and be able to use technical terms and communication appropriately.

Learning skills

 D5.1 Have developed learning capabilities to pursue further studies with a high degree of autonomy.

Obiettivi formativi specifici e risultati di apprendimento attesi (ulteriori info.)

Use of software tools: Students will be able to use R and Java for basic statistical computations.

Application of statistical concepts: Students will be able to apply probabilistic and statistical methods to simple real-world scenarios, such as determining sample sizes for surveys, calculating posterior probabilities for diagnostic tests, or assessing the applicability of the central limit theorem in a given situation.

Modalità di esame

The assessment is based on coursework assignments (30%) and a written final exam (70%). Both assignments and the exam consist of groups of questions built around a hypothetical scenario or a mathematical setting. The questions require students to explore

	different aspects of the scenario or to investigate properties of the setting. Assignments are intended to help students review and deepen the material covered in the lectures, while the exam assesses whether they have achieved the learning outcomes of Knowledge and understanding, Applying knowledge and understanding, and Making judgments.
Criteri di valutazione	Assignments and exams are assessed based on the correctness and clarity of the answers. For students who submit all assignments, the final grade is the weighted average of the exam mark (70%) and the assignment mark (30%). If not all assignments are submitted, the assignment component is reduced in proportion to the number of assignments handed in. In addition, if the mark for a question in an assignment is lower than the corresponding exam mark, the higher exam mark will apply.
